Category:Typefaces and fonts used with EAC Category:Transitional serif typefaces Category:Monospaced typefaces
Category:Typefaces with text figures Category:Unified serif and sans-serif typefaces Category:Typefaces and fonts introduced
in 1976 Category:Typefaces designed by Robert SlimbachQ: How can I perform a custom operation on each element of an
RDD partition? I have an RDD with key-value pairs that looks like this: user_id | status 1 | 0 2 | 0 3 | 0 1 | 0 2 | 1 1 | 1 2 | 0 I am
trying to perform a custom operation on each element of this RDD. Let's say I have two custom functions to calculate a score
and a cost. I want to go through all the partitions and for each user_id where status equals 0, apply my two custom functions, and
update my RDD as follows: user_id | score 1 | 5 2 | 1 3 | 1 1 | 5 2 | 3 1 | 3 2 | 2 I am looking for an efficient way to write this.
First I thought of using mapPartitions for my custom function: def myFunction(element: (String, Int)): Int = ??? val function =
(element: (String, Int)) => { //score element._1 if(element._2 == 0) { 1 } //cost element._2 * 3 } val transformed =
data.mapPartitions(myFunction) But then I realized that since I am 55cdc1ed1c
